#### Abstract

Aim and Objectives: To Assess the morbidity profile of the elderly population in the field practice area of Community Medicine Department, Andhra Medical College, Visakhapatnam. To know the socio demographic profile of elderly population, To Assess the morbidity among elderly population. Methods: This cross-sectional, observational study was carried out at Simhachalam Rural Health Training Center (RHTC), which is a part of the Andhra Medical College's Community Medicine Department. Population in Simhachalam rural health training centre between December 2013 to November 2015. Age of 60 years or older in the RHTC area, with a sample size of 600 . Results: The study population has a mean age of 67.23 years and an SD of 6.8. Ages 60 to 65 made up the majority of the older population, 317 ( $52.8 \%$ ). Only $2.3 \%$ of the participants in the study were beyond 85 . The majority of study participants, $368(61.4 \%)$, are from a backward caste, while $23.6 \%$ are from the Open category and $15 \%$ are from a scheduled caste. The survey participants showed no evidence of any other caste category. Hindus made up the majority of the study's 530 participants ( $88.3 \%$ ). Muslims made up just $10(1.6 \%)$ of the study participants. The majority of the 351 study participants ( $58.5 \%$ ) were married. The majority of the women ( $59 \%$ ) were widowed. This suggests that women generally live longer than men. About 71 (11.8\%) of research participants had completed elementary school, and 64 ( $10.7 \%$ ) had completed middle school. There were 98 or so illiterates ( $16.3 \%$ ). The majority of participants in the current study ( $89.5 \%$ ) were unemployed. $10 \%$ or so were employed. Conclusion: Morbidity was not significantly correlated with gender, education level, or socioeconomic situation. So, regardless of gender, education level, or socioeconomic status, health care for the elderly should be made available to everyone. The present study found no issues with daily living activities because $95-98 \%$ of participants could do them on their own. The majority of the female participants in instrumental daily living activities were still reliant on others for things like using the phone ( $80 \%$ ), getting around $(96 \%)$ and handling money ( $86 \%$ ). Empowering elderly women in these areas is crucial.

Keywords: Morbidity, socio economic status, females, education

## Introduction

Elderly or old age consists of ages nearing or surpassing the average life span of human beings. The boundary of old age cannot be defined exactly because it does not have the same meaning in all societies. Government of India adopted 'National Policy on Older Persons' in January, 1999. The policy defines 'senior citizen' or 'elderly' as a person who is of age 60 years or above.
The medical study of the ageing process is called gerontology and the study of diseases that afflict the elderly is geriatrics. The United Nations World Assembly on Ageing, held at Vienna in 1982, formulated a package of recommendations which gives high priority to researchrelated to developmental and humanitarian aspects of ageing (United Nations, 1987). The plan of action specifically recommended that "International exchange and research cooperation as well as data collection should be promoted in all the fields having a bearing on ageing, in order to provide a rational basis for future social policies and action. Special emphasis should be placed on comparative and cross-cultural studies in ageing".
The phenomenon of population ageing is becoming a major concern for the policy makers all over the world, for both developed and developing countries, during last two decades. But the problems arising out
of it will have varied implications for underdeveloped, developing and developed countries ${ }^{[1]}$. Hence study on this subject would provide valuable information and be useful in policy making.

## Methodology

This cross-sectional, observational study was carried out at Simhachalam Rural Health Training Center (RHTC), which is a part of the Andhra Medical College's Community Medicine Department. Population in Simhachalam rural health centre between December 2013 to November 2015. Age of 60 years or older in the RHTC area, with a sample size of 600 .

Sampling Technique: Three sub centers (Adavivaram1, Lakshminagar and Indiranagar) were selected by lottery method out of twelve subcentres of RHTC and required sample has been equally distributed among three sub centers that is 200 per sub center. House to House survey was done in each sub center till the required sample is achieved.

Inclusion Criteria: Elderly population equal to or more than 60 years willing to participate in the study.
Exclusion Criteria: Elderly 60years and above not willing to participate and very sick elderly.

## Results

Fig 1: Histogram showing age wise distribution of study participants
In the present study, the study participants belong to the age group 60yrs and above. The mean age of the study population is 67.23 yrs with SD of 6.8 .

Table 1: Gender wise distribution of study participants according to Age

| Sex | Age Category |  |  |  | Total (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 60-65yrs | 66-75yrs | 76-85yrs | $>85 \mathrm{yrs}$ |  |
| Male (\%) | 89(28.1) | 101(45.29 | 24(52.17) | 7(50) |  |
| Female (\%) | 228(71.9) | 122(54.71) | 22(47.83) | 7(50) | 379(63.1) |
| Total (\%) | 317(52.8) | 223(37.2) | 46(7.7) | 14(2.3) | 600(100) |

- Majority of elderly were in the age group of $60-65$ years 317 ( $52.8 \%$ ), among them 89 (28.1) were males and $228(71.9 \%)$ were females followed by $223(37.2 \%)$ in the age group of $66-75$ years 101(45.29\%).
- Only $2.3 \%$ of study participants were $>85 \mathrm{yrs}$ of age.

Fig 2: Pie diagram showing caste wise distribution of study participants
Majority $368(61.4 \%)$ of the study participants belongs to backward caste and $23.6 \%$ belong to Open category followed by $15 \%$ study participants belong to scheduled caste.No other caste category was observed among the study participants.

Table 2: Gender wise distribution of study participants according to Religion

| Religion | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Hindu | $205(92.8)$ | $325(85.8)$ | $530(88.3)$ |
| Christian | $14(6.3)$ | $46(12.1)$ | $60(10)$ |
| Muslim | $2(0.9)$ | $8(2.1)$ | $10(1.67)$ |
| Total | $221(100)$ | $379(100)$ | $600(100)$ |

Majority 530(88.3\%) of the study participants were Hindus and $10 \%$ were Christians. Among males about $93 \%$ were Hindus and among females about $86 \%$ were Hindus. Only 10 ( $1.6 \%$ ) study participants were Muslims.

Table 3: Gender wise distribution of the study participants according to Marital status

| Marital status | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Married | $194(87.4)$ | $157(41.4)$ | $351(58.5)$ |
| Widowed | $25(11.6)$ | $222(58.6)$ | $247(41.1)$ |
| Single | $2(1.0)$ | $0(0 \%)$ | $2(0.4)$ |
| Total | $221(100)$ | $379(100)$ | $600(100)$ |

- Majority 351 ( $58.5 \%$ ) of the study participants were married. About $88 \%$ of males were married and only $41 \%$ of females were married.
- Majority of the female were widowed (59\%). This indicates that females live longer than their male counterparts.

Table 4: Distribution of study participants according to Education of the head of the family

| Education | Frequency | \% |
| :---: | :---: | :---: |
| Illiterate | 98 | 16.3 |
| Primary school certificate | 71 | 11.8 |
| Middle school | 64 | 10.7 |
| High school | 178 | 29.7 |
| Intermediate | 61 | 10.2 |
| Graduate | 119 | 19.8 |
| Profession | 9 | 1.5 |
| Total | 600 | 100.0 |

- In the present study majority ( $29.7 \%$ ) of the head of the families had high school education and around $21 \%$ studied graduation and above.
- About 71(11.8\%) had Primary school education and 64(10.7\%) had middle school education. Around $98(16.3 \%)$ were Illiterates.

Table 5: Gender wise distribution of study participants according to Education status

| Gender | Education |  |  |  |  |  |  | Total (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Illiterate Primary/Middle school High schoolintermediate Graduate Profession |  |  |  |  |  |  |  |
| Male (\%) | $\begin{gathered} 43 \\ (19.5) \end{gathered}$ | $\begin{gathered} 48 \\ (21.7) \end{gathered}$ | $\begin{gathered} \hline 27 \\ (12.2) \end{gathered}$ | $\begin{gathered} 64 \\ (28.9) \\ \hline \end{gathered}$ | $\begin{gathered} \hline 15 \\ (6.8) \\ \hline \end{gathered}$ | $\begin{gathered} 21 \\ (9.5) \end{gathered}$ | $\begin{gathered} 3 \\ (1.4) \end{gathered}$ | $\begin{gathered} \hline 221 \\ (100) \\ \hline \end{gathered}$ |
| Female (\%) | $\begin{gathered} \hline 219 \\ (57.8) \\ \hline \end{gathered}$ | $\begin{gathered} 87 \\ (23.0) \\ \hline \end{gathered}$ | $\begin{gathered} \hline 37 \\ (9.7) \end{gathered}$ | $\begin{gathered} \hline 25 \\ (6.6) \\ \hline \end{gathered}$ | $\begin{gathered} 9 \\ (2.4) \\ \hline \end{gathered}$ | $\begin{gathered} 2 \\ (0.5) \\ \hline \end{gathered}$ | 0 | $\begin{gathered} \hline 379 \\ (100) \\ \hline \end{gathered}$ |
| Total (\%) | $\begin{gathered} 262 \\ (43.7) \end{gathered}$ | $\begin{gathered} 135 \\ (22.5) \end{gathered}$ | $\begin{gathered} 64 \\ (10.7) \end{gathered}$ | $\begin{gathered} 89 \\ (14.8) \end{gathered}$ | $\begin{gathered} 24 \\ (4.0) \end{gathered}$ | $\begin{gathered} 23 \\ (3.8) \end{gathered}$ | $\begin{gathered} 3 \\ (0.5) \end{gathered}$ | $\begin{gathered} 600 \\ (100) \end{gathered}$ |

- In the present study majority ( $29.7 \%$ ) of the head of the families had high school education and around $21 \%$ studied graduation and above.
- About 71(11.8\%) had Primary school education and 64(10.7\%) had middle school education. Around 98 ( $16.3 \%$ ) were Illiterates.

Table 6: Gender wise distribution of study participants based on Occupation of the participants

| Occupation | Sex |  | Total (\%) |
| :---: | :---: | :---: | :---: |
|  | Male (\%) | Female (\%) |  |
| Unemployed | $184(83.3)$ | $353(93.1)$ | $537(89.5)$ |
| Un skilled worker | $16(7.2)$ | $24(6.3)$ | $40(6.7)$ |
| Semiskilled worker | $4(1.8)$ | 0 | $4(0.7)$ |
| Skilled worker | $10(4.5)$ | $2(0.5)$ | $12(2.0)$ |
| Clerical | $3(1.4)$ | 0 | $3(0.5)$ |
| Semi profession | $1(0.5)$ | 0 | $1(0.2)$ |
| Profession | $3(1.4)$ | 0 | $3(0.5)$ |
| Total | $221(100)$ | $379(100)$ | $600(100)$ |

In the present study most of the participants were unemployed (89.5\%). Only about $10 \%$ were employed.
Table 7: Distribution of study participants according to total family Income (Modified Kuppuswamy Socio-
Economic classification 2012)

| Total Family income (Rs)/monthFrequency | Percent |  |
| :---: | :---: | :---: |
| $<1600$ | 31 | 5.2 |
| $1601-4809$ | 93 | 15.5 |
| $4810-8009$ | 161 | 26.8 |
| $8010-12019$ | 108 | 18.0 |
| $12020-16019$ | 64 | 10.7 |
| $16020-32049$ | 111 | 18.5 |
| $>32050$ | 32 | 5.3 |
| Total | 600 | 100.0 |

In the present study $31(5.2 \%)$ study participants are getting a total family income of Rs $<1600 /$ - per month. Majority of the study participants are getting a total family income of Rs 4810-8009 per month.

Table 8: Gender wise distribution of study participants according to Socio-Economic Class (Modified Kuppuswamy Socio-Economic classification 2012)
Socio-Economic Class $\mathbf{M a l e}$ (\%) Female (\%) Total (\%)

| Upper Middle | $22(10.0)$ | $36(9.5)$ |
| :---: | :---: | :---: |
| Lower Middle | $82(37.1)$ | $137(36.1)$ |
| $19(36.7)$ |  |  |
| Upper Lower | $104(47.1)$ | $181(47.8)$ |
| Lower | $13(5.8)$ | $25(6.6)$ |
| Total | $221(100)$ | $379(6.3)$ |

In the present study according to modified Kuppuswamy's Socio-Economic Scale, majority of the study participants $285(47.5 \%$ ) belong to upper lower category followed by $219(36.5 \%)$ lower middle category. Only few 38(6.3\%) belong to lower class.

# Journal of Cardiovascular Disease Research <br> ISSN:0975-3583,0976-2833 <br> VOL14,ISSUE05,2023 

Fig 3: Distribution of study participants according to Type of family

- Majority of the study participants $484(81 \%)$ belong to Three generation families followed by $110(18.0 \%)$ of elderly belong to Nuclear families.
- Only $6(1 \%)$ belong to joint family.

Table 9: Gender wise Distribution of study participants according to their Living arrangement

| Living arrangement | Male (\%) |  | Female (\%) |
| :---: | :---: | :---: | :---: |
| Sotal (\%) |  |  |  |
| Staying with spouse <br> Stay with children <br> Other family members | $44(19.9)$ | $66(17.4)$ | $110(18.3)$ |
| Stays single or with other than family members | $0(0)$ | $1(0.3)$ | $1(0.3)$ |
| Total | $221(100)$ | $379(100)$ | $600(100)$ |

In the present study $110(18.3 \%)$ were staying with their spouse and majority 489 ( $81.4 \%$ ) of study participants are living with children and grand children.

Table 10: Gender wise distribution of study participants according to presence of morbidity

| Morbidity | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Present | $171(77.4)$ | $273(72.0)$ | $444(74)$ |
| Absent | $50(22.6)$ | $106(28.0)$ | $156(26)$ |
| Total | $221(100)$ | $379(100)$ | $600(100.0)$ |

In the present study majority $444(74 \%)$ of the study participants were suffering from one or other morbidity. Among males $77 \%$ and in females $72 \%$ were having one or other Morbidity.

Table 11: Distribution of study participants according to system wise morbidity

| System | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Visual problems | $162(37.4)$ | $272(62.6)$ | $434(100)$ |
| Musculoskeletal problems | $126(27)$ | $248(73)$ | $374(100)$ |
| Cardio vascular problems/hypertension | $103(36.3)$ | $181(63.7)$ | $284(100)$ |
| Dental problems | $74(37.8)$ | $127(62.2)$ | $201(100)$ |
| Endocrine/type2 diabetes | $75(43.4)$ | $98(56.6)$ | $173(100)$ |
| Ear Nose Throat/hearing loss | $61(41.2)$ | $87(58.8)$ | $148(100)$ |
| Gastro intestinal problems | $60(40.3)$ | $82(59.7)$ | $142(100)$ |
| Anaemia | $35(27.8)$ | $91(72.2)$ | $126(100)$ |
| Skin problems | $36(38.7)$ | $57(61.3)$ | $93(100)$ |
| Central Nervous system/Cerebro vascular problems | $29(40.3)$ | $43(59.7)$ | $72(100)$ |
| Respiratory problems | $32(45.1)$ | $39(54.9)$ | $71(100)$ |
| Genitourinary problems | $11(50)$ | $11(50)$ | $22(100)$ |
| Malignancies | $1(17)$ | $5(83)$ | $6(100)$ |

Majority of the study participants $434(72.3 \%$ ) had visual problems, followed by Musculoskeletal 374(62.3\%), Cardiovascular/HTN 284(47.3\%), 201(33.5\%) Dental problems, 73(28.8\%) Endocrine/DMproblems, 148(24.7\%) ENT/Hearing loss, 142(23.7\%) Gastrointestinal, 126(21\%) Anaemia, $93(15.5 \%)$ Skin problems, $72(12 \%)$ CNS, $70.8(11.8 \%)$ Respiratory problems 22.2(3.7\%), $1 \%$ suffering with Genitourinary problems and Malignancy.

Table 12: Gender wise Distribution of study participants according to Eye morbidity

| Eye morbidity | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Defective vision/Presbiopia | $152(68.8)$ | $225(59.4)$ | $377(62.8)$ |
| Cataract | $55(24.8)$ | $146(38.5)$ | $201(33.5)$ |
| Refractive error | $22(9.9)$ | $32(8.4)$ | $54(9.0)$ |
| Corneal opacity | $0(0)$ | $3(0.8)$ | $3(0.5)$ |
| No eye problems | $59(26.7)$ | $107(28.2)$ | $166(27.7)$ |

## \# one person can give multiple responses

- Majority $(72.3 \%)$ of the study participants were having one or more eye problems.
- About $69 \%$ of males and $59 \%$ of females have defective vision/presbiopia.
- Majority $38.5 \%$ of the female study participants were suffering with cataract, while $24.8 \%$ of the Male participants were suffering from cataract.

Table 13: Gender wise distribution of study participants according to Musculoskeletal problems

| Musculoskeletal problems | Male (\%) | Female (\%) Total (\%) |  |
| :---: | :---: | :---: | :---: |
| Arthritis | $69(31.2)$ | $172(45.4)$ | $241(40.2)$ |
| Myalgia | $44(19.9)$ | $75(19.8)$ | $119(19.8)$ |
| Back ache | $46(20.8)$ | $108(28.5)$ | $154(25.7)$ |
| Cervical Spondylitis | $5(2.3)$ | $4(1.1)$ | $9(1.5)$ |
| Others | $3(1.4)$ | $9(2.4)$ | $12(2.0)$ |
| No Musculoskeletal problems | $95(43)$ | $131(34.6)$ | $226(37.7)$ |

- About $62 \%$ of the study participants had Musculoskeletal problems. Most common musculoskeletal problem was arthritis $241(40 \%)$ followed by back ache 154 ( $25.7 \%$ ) and myalgia $119(20 \%)$.
- Musculoskeletal problems were more among females $65.4 \%$ when compared to males $57 \%$.

Table 14: Gender wise distribution of study participants according to cardiovascular (CVS) problems

| CVS problems | Male (\%) |  | Female (\%) |
| :---: | :---: | :---: | :---: |
| HTatal (\%) |  |  |  |
| HTN | $93(42.1)$ | $180(47.5)$ | $273(45.5)$ |
| IHD/Post MI | $18(8.1)$ | $11(2.9)$ | $29(4.8)$ |
| OTHERS | $2(0.9)$ | $1(0.5)$ | $3(0.5)$ |
| No CVS problems | $118(53.4)$ | $198(89.6)$ | $316(52.7)$ |

- Cardio Vascular problems were seen in $47.3 \%$ of the study population.
- Hypertension was the most common 273(45.5\%) cardiovascular problem. About $42 \%$ of males and $48 \%$ of females were Hypertensive.
- About $5 \%$ of the study participants were suffering from IHD/Post MI. This problem was more in males $(8 \%)$ as compared to females (3\%).

Table 15: Gender wise distribution of study participants according to Dental problems

| Dental problems | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Dental caries | $38(17.2)$ | $70(18.5)$ | $108(18.0)$ |
| Chewing problems | $25(11.3)$ | $34(9.0)$ | $59(9.8)$ |
| edentulous | $29(13.1)$ | $42(11.0)$ | $71(11.8)$ |
| Others | $0(0)$ | $5(1.3)$ | $5(0.8)$ |
| No dental problems | $147(66.5)$ | $252(66.5)$ | $399(66.5)$ |

- Most common dental problem in the study population was dental caries $108(18 \%)$.
- Among males $17.2 \%$ were having dental caries and in females $18.5 \%$ were having caries teeth.
- Chewing problems and edentulous were about $2 \%$ more in males than females.

Table 16: Gender wise Distribution of study participants according to Endocrine problems

| Endocrine problems | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Diabetes Mellitus | $75(33.9)$ | $92(24.3)$ | $167(27.8)$ |
| Thyroid diseases | $0(0)$ | $9(2.4)$ | $9(1.5)$ |
| Others | $0(0)$ | $2(0.5)$ | $2(0.3)$ |
| No endocrine problems | $146(66.1)$ | $281(74.1)$ | $427(71.2)$ |

- Among study subjects $173(28.8 \%)$ had one or more endocrine problems and most common endocrine problem was Diabetes Melites167(27.8\%).
- Diabetes was more among males $34 \%$ as compared to females $24 \%$.
- Thyroid disorder was seen only in female (2.4\%) study participants.

# Journal of Cardiovascular Disease Research <br> ISSN:0975-3583,0976-2833 <br> VOL14,ISSUE05,2023 

Table 17: Gender wise distribution of study participants according Ear Nose Throat morbidity

| Ear problems | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Impaired hearing | $61(27.6)$ | $85(22.4)$ | $146(24.3)$ |
| CSOM | $0(0)$ | $2(0.5)$ | $2(0.3)$ |
| No ear problems | $160(72.4)$ | $292(77.1)$ | $452(75.3)$ |

- The analysis shows that out of 600 study subjects 146 (24.3\%) had impaired hearing.
- About $28 \%$ of males and $22 \%$ of females had impaired hearing.

Table 18: Gender wise Distribution of study participants according to Gastrointestinal problems

| GI disorders | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Constipation | $43(19.5)$ | $49(12.9)$ | $92(15.3)$ |
| Hemorrhoids | $2(0.9)$ | $7(1.8)$ | $9(1.5)$ |
| Acid Peptic Disease | $26(11.8)$ | $43(11.3)$ | $69(11.5)$ |
| Others | $1(0.5)$ | $1(0.3)$ | $2(0.3)$ |
| No GI problems | $161(72.9)$ | $297(78.4)$ | $458(76.3)$ |

- About $24 \%$ of the study population had gastro intestinal problems. Common GI problem among study population was constipation 92(15\%) followed by Acid Peptic disease 69(11.5\%).
- Constipation was more in males $43(20 \%)$ than females $49(13 \%)$.

Table 19: Gender wise distribution of study participants according to Anaemia

| Anaemia | Sex |  |  |
| :---: | :---: | :---: | :---: |
|  | Male (\%) | Female (\%) Total (\%) |  |
| Anaemia present | $35(15.8)$ | $91(24.0)$ | $126(21.0)$ |
| No Anaemia | $186(84.2)$ | $288(76.0)$ | $474(79.0)$ |
|  | $221(100)$ | $379(100)$ | $600(100)$ |

- Among the study participants $126(21 \%)$ had anaemia.
- Anaemia was more among females $24 \%$ as compared to males ( $16 \%$ ).

Table 20: Gender wise distribution of study participants according to skin problems

| Skin conditions | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Pyoderma | $5(2.3)$ | $9(2.4)$ | $14(2.3)$ |
| Fungal disease | $6(2.7)$ | $8(2.1)$ | $14(2.3)$ |
| Other skin problems (dermatitis, eczema) | $27(12.2)$ | $43(11.4)$ | $70(11.7)$ |
| No Skin problems | $185(83.7)$ | $322(85.0)$ | $507(84.5)$ |

- About $16 \%$ of the study population had skin problems.
- Fungal infections (2.3\%) and Pyoderma (2.3\%) were commonest skin problems in the study population.

Table 21: Gender wise distribution of study participants according to Central Nervous System (CNS) morbidity

| CNS problem | Male (\%) | Female\% | Total (\%) |
| :---: | :---: | :---: | :---: |
| Memory impairment | $18(8.1)$ | $29(7.7)$ | $47(7.8)$ |
| Seizures | $2(0.9)$ | $1(0.3)$ | $3(0.5)$ |
| CVA | $8(3.6)$ | $7(3.2)$ | $15(2.5)$ |
| Others | $2(0.9)$ | $6(1.9)$ | $8(1.3)$ |
| No CNS problems | $192(86.9)$ | $336(88.7)$ | $528(88.0)$ |

- Among study population $12 \%$ had problems related to CNS.
- Most common CNS problem was memory impairment ( $8 \%$ ) both in male and female subjects.
- About $2.5 \%$ of the study participants were suffering from CVA's (residual paresis/paralysis) and $0.5 \%$ were suffering with Seizure disorders.

Table 22: Gender wise distribution of study participants according to Respiratory problems

| Respiratory problems | Male (\%) | Female (\%) | Total (\%) |
| :---: | :---: | :---: | :---: |
| Tuberculosis | $2(0.9)$ | $2(0.5)$ | $4(0.7)$ |
| COPD | $23(10.4)$ | $17(4.5)$ | $40(6.7)$ |
| Asthma | $8(3.6)$ | $16(4.2)$ | $24(4)$ |
| Others | $8(3.6)$ | $11(2.9) \mathrm{s}$ | $19(3.2)$ |
| No respiratory problems | $189(85.5)$ | $340(89.7)$ | $529(88.2)$ |

# Journal of Cardiovascular Disease Research <br> ISSN:0975-3583,0976-2833 <br> VOL14,ISSUE05,2023 

- Around $11.8 \%$ of the study participants had respiratory problems.
- Most common respiratory problem was COPD 40 (6.7\%) followed by Bronchial Asthma $4 \%$.

Table 23: Gender wise distribution of study participants according to Genitourinary problems

| Genitourinary problems | Male (\%) | Female (\%) | Percentage (\%) |
| :---: | :---: | :---: | :---: |
| Dysuria/Incontinence | $9(4.1)$ | $5(1.3)$ | $14(2.3)$ |
| Others | $2(0.9)$ | $6(1.6)$ | $8(1.3)$ |
| No Genitourinary problems $210(95.0)$ | $368(97.1)$ | $578(96.3)$ |  |

- About $4 \%$ of the study subjects had genito urinary problems.
- Most common genito urinary problem among study subjects was 14(2.3\%) dysuria/incontinence.

Table 24: Distribution of study participants according to Sex and morbidity

| Sex | Morbidity |  | Total (\%) |
| :---: | :---: | :---: | :---: |
|  | Present | Absent |  |
| Male (\%) | $171(77.4)$ | $50(22.6)$ | $221(100)$ |
| Female (\%) | $273(72.0)$ | $106(28.0)$ | $379(100)$ |
| Total (\%) | $444(74.0)$ | $156(26.0)$ | $600(100)$ |

Any kind of morbidity present in males was among 171 subjects and in females was among 273 subjects and this difference was not statistically significant.

Table 25: Distribution of study participants according to age and morbidity

| Age category | Morbidity | Total (\%) |  |
| :---: | :---: | :---: | :---: |
|  | Present (\%) | Absent (\%) |  |
| $60-65 \mathrm{yrs}$ | $183(57.7)$ | $134(42.3 \%)$ | $317(100)$ |
| $66-75 \mathrm{yrs}$ | $201(90.1 \%)$ | $22(9.9 \%)$ | $223(100)$ |
| $76-85 \mathrm{yrs}$ | $46(100)$ | 0 | $46(100)$ |
| $>85 \mathrm{yrs}$ | $14(100)$ | 0 | $14(100)$ |
| Total (\%) | $444(74)$ | $156(16)$ | $600(100)$ |

Chi-square value $=94.4, \mathrm{df}=3, \mathrm{P}=0.001$

- As the age increase the presence of morbidity also increases, this association was statistically significant.

Table 26: Distribution of study subjects according to SES class and Morbidity

| SES class | Morbidity |  | Total (\%) |
| :---: | :---: | :---: | :---: |
|  | Present | Absent |  |
| upper middle | $45(75 \%)$ | $15(25 \%)$ | $60(100 \%)$ |
| lower middle | $161(73.5 \%)$ | $58(26.5 \%)$ | $219(100)$ |
| upper lower | $209(73.3 \%)$ | $76(26.7 \%)$ | $285(100)$ |
| lower | $26(72.2 \%)$ | $10(27.8 \%)$ | $36(100)$ |
| Total (\%) | $441(73.5 \%)$ | $159(26.5 \%)$ | $600(100)$ |

Chi-square $=0.475, \mathrm{df}=3, \mathrm{P}=0.92$,
In our study presence of morbidity was not significantly associated with socio economic class.
Table 27: Distribution of study participants according to Education and Morbidity

| Education | Morbidity |  | Total (\%) |
| :---: | :---: | :---: | :---: |
|  | Present | Absent |  |
| Illiterate (\%) | $186(70.9)$ | $76(29.1)$ | $262(100)$ |
| Primary school (\%) | $102(75.5)$ | $33(24.5)$ | $135(100)$ |
| Middle school (\%) | $51(79.7)$ | $13(20.3)$ | $64(100)$ |
| High school (\%) | $65(73.0)$ | $24(27.0)$ | $89(100)$ |
| Intermediate (\%) | $19(79.2)$ | $5(20.8)$ | $24(100)$ |
| Graduate (\%) | $20(87.0)$ | $3(13)$ | $23(100)$ |
| Profession (\%) | $1(33.3)$ | $2(66.7)$ | $3(100)$ |
| Total (\%) | $444(74.0)$ | $156(26.0)$ | $600(100)$ |

Chi-square $=7.49, \mathrm{df}=6, \mathrm{P}=0.82$,
Educational status of the study population was not significantly associated with morbidity in the present study.

# Journal of Cardiovascular Disease Research <br> ISSN:0975-3583,0976-2833 <br> VOL14,ISSUE05,2023 

Table 28: Distribution of study participants according to Activities of daily living

| Activity | Dependent <br> $\mathbf{n}(\%)$ | Partially dependentIndependent <br> $\mathbf{n}(\%)$ | n(\%) |
| :---: | :---: | :---: | :---: |
| Bathing | $1(0.2)$ | $18(3)$ | $581(96.8)$ |
| Dressing | $2(0.3)$ | $17(2.8)$ | $581(96.8)$ |
| Toilet use | $1(o .2)$ | $17(2.8)$ | $582(97.0)$ |
| Moving about | $1(0.2)$ | $18(3)$ | $581(96.8)$ |
| Grooming | 0 | $17(2.8)$ | $583(97.2)$ |
| Feeding | 0 | $16(2.7)$ | $584(97.3)$ |
| Mobility | $2(0.3)$ | $19(3.2)$ | $579(96.5)$ |
| Stairs | $4(0.7)$ | $25(4.2)$ | $571(95.2)$ |
| Activity | Incontinent | Occasional accident | Continent |
| Bowels | $1(0.2)$ | $3(0.5)$ | $596(99.3)$ |
| Bladder | $2(0.3)$ | $3(0.5)$ | $595(99.2)$ |

- Majority of the study participants (95 to $99 \%$ ) were independent and able to perform their Activities of Daily Living.
- Only few were partially dependent for activities like bathing 18(3\%), for dressing17 (2.8\%), for toilet use 17 (2.8\%).

Table 29: Distribution of study participants according to Gender and ADL

| ADL | Sex |  | Total ( $\mathrm{n}=600$ ) | $\mathrm{X}^{2}$ | $\mathbf{P}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male ( $\mathrm{n}=221$ ) Female ( $\mathrm{n}=379$ ) |  |  |  |  |
|  | n (\%) | n (\%) | n (\%) |  |  |
| Bathing | 214(96.8) | 367 (96.8) | 581(96.8) | 1.81 | . 405 |
| Dressing | 215(97.3) | 366 (96.6) | 581 (96.8) | 0.55 | 0.756 |
| Toileting | 214 (96.8) | 368 (97.1) | 582 (97.0) | 1.73 | 0.420 |
| Transfer | 214 (96.8) | 367 (96.8) | 581 (96.8) | 1.81 | 0.405 |
| Grooming | 215 (97.3) | 368 (97.1) | 583 (97.2) | 0.89 | 0.55 |
| Feeding | 215 (97.3) | 369 (97.4) | 584 (97.3) | 0.95 | 1.0 |
| Bowels | 219 (99.1) | 377 (99.4) | 596 (99.3) | 1.73 | 0.42 |
| Bladder | 218 (98.6) | 377 (99.4) | 595 (99.2) | 1.3 | 0.52 |
| Stairs | 209(94.5) | 362 (95.5) | 571(95.2) | 0.80 | 0.66 |

- About 95 to $99 \%$ of the elderly were independent in performing activities of daily living.
- More females were partially dependent when compared with males.

Table 30: Distribution of study participants according to Age and Activities of Daily Living

| ADL | Age Category |  |  |  |  | $\mathbf{P}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{6 0 - 6 5 y r s}$ <br> $\mathbf{n = 3 1 7}(\%)$ | $\mathbf{6 6 - 7 5 y r s}$ <br> $\mathbf{n = 2 2 3}(\%)$ | $\mathbf{7 6 - 8 5 y r s}$ <br> $\mathbf{n}=\mathbf{4 6}(\%)$ | $\mathbf{8 5 y r s}=\mathbf{1 4}(\%)$ | $\mathbf{N}=\mathbf{6 0 0}(\%)$ |  |
|  | $311(98.1)$ | $215(96.4)$ | $43(93.5)$ | $11(78.6)$ | $580(96.7)$ | 0.06 |
| Dressing | $311(98.1)$ | $215(96.4)$ | $43(93.5)$ | $11(78.6)$ | $580(96.7$ | 0.06 |
| Toilet use | $312(98.4)$ | $215(96.4)$ | $43(93.5)$ | $11(78.6)$ | $581(96.8)$ | 0.03 |
| Move about | $311(98.1)$ | $215(96.4)$ | $43(93.5)$ | $11(78.6)$ | $580(96.7)$ | 0.06 |
| Grooming | $312(98.4)$ | $216(97.3)$ | $43(93.5)$ | $11(78.6)$ | $582(97.0)$ | 0.009 |
| Feeding | $312(98.4)$ | $217(95.9)$ | $43(93.5)$ | $11(78.6)$ | $583(97.2)$ | 0.007 |
| Mobility | $311(98.1)$ | $214(96.0)$ | $43(93.5)$ | $10(71.5)$ | $579(96.5)$ | 0.002 |
| Stairs | $309(97.5)$ | $211(94.6)$ | $41(93.5)$ | $9(64.3)$ | $570(95.0)$ | 0.0001 |
| Bowels continence | $317(100)$ | $219(98.2)$ | $46(100)$ | $14(100)$ | $592(98.7)$ | 0.341 |
| Bladder continence | $317(100)$ | $220(98.6)$ | $45(97.8)$ | $13(78.6)$ | $581(92.8)$ | 0.000 |

Majority of the study subjects about $95 \%$ to $98 \%$ were able to do Activities of daily Living independently. Certain activities like toilet use, grooming, feeding, mobility and climbing stairs were having statistically significant association ( $\mathrm{p}=<0.05$ ) with age of the individual.

Table 31: Distribution of study participants according to SES and ADL

|  | ADL | Chi-square value | P |
| :---: | :---: | :---: | :---: |
|  | Bathing | 1.840 | 0.934 |
|  | Dressing | 3.546 | 0.78 |
|  | Toilet use | 1.813 | 0.936 |
|  | Move about | 1.84 | 0.934 |
|  | Grooming | 0.427 | 0.935 |
|  | Feeding | 0.285 | 0.963 |
|  | Mobility | 3.49 | 0.79 |

|  | Stairs | 10.13 | 0.11 |
| :--- | :--- | :--- | :--- |

- Chi square test was done for ADL and socio economic class (SES) according to modified kuppuswamy SES scale and it was found that they were not significantly associated.

Table 32: Gender wise distribution of study participants on performance of IADL

| IADL | Sex |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Male=221 | Female=379 | Total=600P-value |  |
|  | $\mathbf{n ( \% )}$ | $\mathbf{n ( \% )}$ | $\mathbf{n ( \% )}$ |  |
| Administering own medication | $219(94.6)$ | $354(93.4)$ | $573(95.5)$ | 0.567 |
| Grocery shopping | $193(87.3)$ | $309(81.5)$ | $502(83.7)$ | 0.064 |
| Preparing meals | $170(76.9)$ | $299(78.9)$ | $469(78.2)$ | 0.573 |
| Using telephone | $122(55.2)$ | $74(19.5)$ | $196(32.7)$ | 0.001 |
| Driving and transportation | $65(29.4)$ | $16(4.2)$ | $81(13.5)$ | 0.001 |
| Handling own finances | $116(52.5)$ | $51(13.5)$ | $167(27.8)$ | 0.001 |
| House keeping | $200(90.5)$ | $343(90.5)$ | $543(90.5)$ | 0.999 |
| Bed Making | $199(90)$ | $353(93.1)$ | $552(92.0)$ | 0.178 |
| Laundry | $195(88.2)$ | $345(91.0)$ | $540(90.0)$ | 0.271 |

- Majority of study subjects $95.5 \%$ were able to administer their own medication, $83.7 \%$ were able to do grocery shopping, $78.2 \%$ were able to prepare meals by themselves.
- About $32.7 \%$ were able to use telephone, $13.5 \%$ were able to drive, $27.8 \%$ were able to handle their own finances.
- About $90.5 \%$ were able to do housekeeping, $92 \%$ were able to do bed making and $90 \%$ were able to do laundry activities.
- More male were able to use telephone, handle own finances, and transportation than female counterparts and this difference is statistically significant.
- More females were able to do bed making, preparing meals and laundry than males and this difference was not statistically significant.

Table 33: Distribution of study participants according to Instrumental Activities of Daily Living and AGE

| IADL | Age Category |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{6 0 - 6 5} \mathbf{n}(\%)$ | $\mathbf{6 6 - 7 5}(\%)$ | $\mathbf{7 6 - 8 5}(\%)$ | $\mathbf{8 5 ( \% )}$ | Total (\%) | P value |
|  | $\mathbf{3 1 7 ( 5 2 . 8 )}$ | $\mathbf{2 2 3 ( 3 7 . 2 )}$ | $\mathbf{4 6 ( 7 . 7 )}$ | $\mathbf{1 4 ( 2 . 3 )}$ | $\mathbf{6 0 0 ( 1 0 0 )}$ |  |
| Administering own medication | $308(97.2)$ | $206(92.4)$ | $41(89.1)$ | $8(57.1)$ | $563(93.8)$ | 0.001 |
| Grocery shopping | $294(92.7)$ | $175(78.5)$ | $28(60.9)$ | $5(35.7)$ | $502(83.6)$ | 0.001 |
| Preparing meals | $276(87.1)$ | $164(80.8)$ | $27(58.7)$ | $2(14.3)$ | $469(78.2)$ | 0.001 |
| Using telephone | $95(30.0)$ | $80(35.9)$ | $18(39.3)$ | $4(28.6)$ | $197(32.8)$ | 0.32 |
| Driving and transportation | $38(12.0)$ | $36(16.1)$ | $6(13)$ | 0 | $81(13.5)$ | 0.28 |
| Handling own finances | $79(24.9)$ | $71(31.8)$ | $16(34.8)$ | 0 | $167(27.8)$ | 0.03 |
| House keeping | $301(94.9)$ | $195(87.4)$ | $40(86.9)$ | $7(50.0)$ | $543(90.5)$ | 0.001 |
| Laundry | $300(94.6)$ | $199(89.2)$ | $34(73.9)$ | $7(50.0)$ | $539(90.0)$ | 0.001 |
| Bed making | $304(95.9)$ | $200(89.7)$ | $41(89.1)$ | $6(42.9)$ | $551(91.8)$ | 0.001 |

- In the age group 60-65 years majority $97.2 \%$ of study subjects were able to administer their own medication, in the age group $76-85$ years $89.1 \%$ were able to administer their own medication where as in the age group above 85 years only $57.1 \%$ were able to administer their medication
- In the age group 60-65 years majority $92.7 \%$ were able to do grocery shopping where as in the age group 76-85 years $60.9 \%$ were able to do grocery shopping.
- Similarly, in the age group 60-65 years $24.9 \%$ were able to handle their own finances, $94.9 \%$ were able to perform the activities of housekeeping, and $94.6 \%$ were able to perform laundry activities.
- In the age group 76-85 years $34.8 \%$ were able to handle own finances, $86.9 \%$ and $73.9 \%$ were able to perform the activities of housekeeping and laundry respectively.
- Significant statistical association was found between the age of elderly and most of the instrumental activities of daily living ( $\mathrm{p}=0.001$ ). It was observed that as the age increases there is decrease in activities. As the age progresses the degenerative changes leads to decrease in various body functions.
- Chi square was done for the Age of elderly with IADL shows that there was significant statistical difference for the activities like administering own medication, grocery shopping, preparing meals, bed making and laundry.
- Significant association was found between the sex of elderly and certain instrumental activities of daily living, (p<0.001).
- Significantly more number of studied males were able to use telephone, do driving and transportation and able to handle own finances than elderly females.
- Significantly more number of studied females were able to perform activities like preparation of meals
housekeeping, bed making and laundry activities than males.
Table 34: Distribution of study participants according to Socio economic status and IADL

| SES | IADL | Chi square value | P |
| :---: | :---: | :---: | :---: |
| $\cdot$ | Administering own medication | 1.643 | 0.650 |
|  | Grocery shopping | 0.436 | 0.933 |
|  | Preparing meals | 2.219 | 0.528 |
|  | Telephone use | 39.344 | 0.001 |
|  | Driving/Transport | 8.532 | 0.036 |
|  | Handling own finance | 21.052 | 0.001 |
|  | Housekeeping | 4.004 | 0.261 |
|  | Bedmaking | 5.221 | 0.156 |
|  | Laundry | 8.552 | 0.036 |

- Significant association was found between the sex of elderly and certain instrumental activities of daily living, ( $\mathrm{p}<0.001$ ).
- Significantly more number of studied males were able to use telephone, do driving and transportation and able to handle own finances than elderly females.
- Significantly more number of studied females were able to perform activities like preparation of meals housekeeping, bed making and laundry activities than males.

## Discussion

The study is discussed comparing the results of the study with various other similar studies.

## Age

In the present study majority 317 ( $52.8 \%$ ) of the study participants belongs to the age group of 60-65 years among them $89(28.1 \%)$ were males and $228(71.9 \%)$ were females. Our study findings correlate with the findings of a similar study done by Lena et al., ${ }^{[6]}$ in 2009, Muralidhar MK et al., ${ }^{[7]}, 2014$ in Karnataka and Vandana Nikumb et al., ${ }^{[8]}$ in 2015 study in Urban Navi Mumbai where major fraction of the population are in the age group of 60-69 years.
In our study mean age of the study participants was 67.23 with SD of 6.8 . Similar findings were observed in Bhawalkar J.S et al., ${ }^{[9]}$ study done 2009 where the mean age was 66.33 years with SD 6.7 and Vandana Nikumb et al., ${ }^{[8]}$ in 2015 where mean age of study participants was 66.61 years with SD 6.54.

## Sex

In the present study majority $379(63.17 \%$ ) of the study participants were females the ratio of male to female elderly was $1: 1.58$. Our study findings correlate with the findings of a similar study done by Vandana Nikumb et al., ${ }^{[15]} 2015$ in an urban area at Navi Mumbai where were more number of females 110 (68.8\%) \& study done by Bhawalkar J.S et al., ${ }^{[9]} 2013$ in urban area of Pune with females 898(55.3\%), Jadhav VS et al., ${ }^{[10]} 2012$ in the field practice area of Rural Health Centre at Aurangabad with females 328 ( $52.48 \%$ ).

## Religion

In the present study majority were Hindus i.e. 530 ( $88.3 \%$ ) followed by Christians $60(10 \%)$ and Muslims $10(1.7 \%)$ which are similar with that of the findings of Syed Qadri et al., ${ }^{[13]}(90 \%)$ done in north India 2013, Shiva Kumar S et al., ${ }^{[11]}$ study (74\%) done in Arehalli village of Hassan district Karnataka in 2013 and MK Muralidhar et al., ${ }^{[7]}$ study (78\%) in 2014.

## Literacy status

In the present study $262(43.7 \%)$ were Illiterates, constituting $43(19.5 \%)$ males \& $219(57.7 \%)$ females. Around 338(56.3\%) were Literates, constituting 178(80.5\%) males \& 160(42.3\%) females. Among the study participants $135(22.5 \%)$ had studied upto primary school, followed by high school $89(14.8 \%)$, middle school 64(10.7\%), Intermediate $24(4 \%)$, graduates $23(3.8 \%)$ and $3(0.5 \%)$ were professional.
In the present study, Majority of the female participants ( $57.7 \%$ ) were illeterates which are similar with that of findings in studies done by Sanjiv Kumar Barman et al., ${ }^{[12]}$ study ( $59.37 \%$ ) done in an urban community of Bihar 2014, MK Muralidhar et al., ${ }^{[7]}$ study ( $68.4 \%$ ) done in a rural community of costal Karnataka 2014.

## Marital status

Among 600 study population maximum 351(58.5\%) were married. Out of 247 (41.1\%) widowed, 222 ( $90 \%$ ) were females as compared to $25(10 \%)$ males. Similar findings were observed in a study conducted by Syed Qadri ${ }^{[13]}$ and SK Ahluwalia et al., 2013 in an epidemiological study conducted among rural elderly of North India, out of 660 respondents majority were married ( $60.81 \%$ ).
In a similar study by MK Muralidhar et al., ${ }^{[7]} 2014$ on morbidities among elderly in a rural community of costal Karnataka, out of 276 elderly about $165(60 \%)$ were married, $104(37.68 \%)$ were widowed, $4(1.4 \%)$

# Journal of Cardiovascular Disease Research ISSN:0975-3583,0976-2833 VOL14,ISSUE05,2023 

had divorced and 3 (1\%) of them were unmarried.

## Living arrangement

In the present study coming to living arrangement among 600 elderly studied, 110(18.3\%) are staying with spouse alone, 489 ( $81.5 \%$ ) are staying with children or other family members and only $1(0.2 \%)$ was staying single.
Similar findings were seen in study done by SK Ahluwalia et al., 2013 in an epidemiological study conducted among rural elderly of North India, out of 660 respondents $<1 \%$ were staying alone.

## Type of family

Among 600 study participants majority 484 ( $80.7 \%$ ) belong to three generation family, 110(18.3\%) belong to Nuclear family and $6(1 \%)$ were in joint family.
In a study done on elderly in urban Mysore, Karnataka, India by Shraddha K et al., ${ }^{[14]} 2012$ observed $48.9 \%$ belong to Nuclear family and $34.8 \%$ belonged to three generation family. In another study findings of morbidity profile of geriatric population in an urban community Bihar by Sanjiv Kumar Barman et al., ${ }^{[12]} 2014$ showed $40 \%$ belong to Nuclear family and $23.7 \%$ belonged to three generation family.
In the present study only $1 \%$ belongs to joint family. Contrary to our study findings around $72.7 \%$ of the elderly are in joint family in an epidemiological study on quality of life among rural elderly of North India by Syed Qadri et al., ${ }^{[13]} 2013$ and $75 \%$ In an another study on morbidity profile of elderly in Arehalli village of Hasan district by Shivakumar S et al., ${ }^{[11]} 2013$ and $92.7 \%$ belong to joint family in study done by Rajshree Bhatt et al., ${ }^{[15]}$ in Ahemadabad 2011.

## Socio economic status

In the present study analysis shows $323(53.8 \%)$ of subjects belong to lower and upper lower class, $219(36.5 \%)$ lower middle, $58(9.7 \%)$ upper middle class and there was no one in upper class.
Similar findings were observed in studies done by S.V. Kumble et al., in 2012 (34.6\%), Shraddha K et al., ${ }^{[14]}(64.8 \%)$ in 2012 in urban population of Mysore, Vandana Nikumb et al., ${ }^{[8]} 2015$ (97.5\%) in an urban area at Navi Mumbai where majority of the elderly were from lower and upper lower class.
In our study none of the elderly belongs to upper class. Similar findings were observed in Vandana Nikumb et al., ${ }^{[8]} 2015$ and Sanjiv Kumar Barman et al., ${ }^{[12]} 2014$ in an urban Bihar.

## Occupation

In the present study of 600 elderly $537(89.5 \%)$ were unemployed and $63(10.5 \%)$ were employed. Among males, unemployed were $184(83.3 \%$ ) and among females $353(93.1 \%)$ were unemployed. Unskilled workers were $40(6.7 \%)$. Skilled workers were12(2\%), semiskilled workers were $4(0.7 \%)$, $3(0.5 \%)$ were clerical, business or shop owners. Semi profession1 $(0.2 \%)$ and $3(0.5 \%)$ were professionals. There were no females in semiprofessional or professionals.
Similar findings were seen in a study done by Shraddha K et al., ${ }^{[14]} 2012$ done among elderly in urban population of Mysore where $68.8 \%$ of the respondents were unemployed.
Contrary to our study findings only $10.00 \%$ were unemployed in a study done by Sanjiv Kumar Barman et al., ${ }^{[12]} 2014$ in urban community in Bihar, $18.2 \%$ were not working in an epidemiological study on quality of life among rural elderly population of North India by Syed Qadri et al., $2013{ }^{[13]}$.
In a study of morbidity profile of geriatric population in an urban community in Bihar by Sanjiv Kumar Barman et al., $2014{ }^{[12]}$, It was observed that out of 160 elderly studied $30(18.75 \%)$ of them were working as agricultural labour in the field, $38(23.75 \%)$ has their own business, $56(35.00 \%)$ were daily wage earners or daily laborers. $20(12.50 \%)$ belong to the other group (cobbler, canning worker, mattress making, etc.) and $16(10.00 \%)$ were not having any occupation due to physical disability.
In an epidemiological study on quality of life among rural elderly population of North India by Syed Qadri et al., $2013{ }^{[13]}$ shows that among 660 elderly $359(54.4 \%)$ were Household, 85(12.9\%) agriculture, $36(5.6 \%)$ doing business, $7(1.06 \%)$ service, $30(4.5 \%)$ were unskilled labour, 24(3.6\%) skilled labour and $119(18.2 \%)$ were not working.
In a similar study on morbidity pattern among elderly in urban population of Mysore by Shraddha K et al., $2012{ }^{[14]}$ observed that out of 526 elderly $68.8 \%$ of the respondents were unemployed followed by $16.2 \%$ unskilled worker, $5.9 \%$ semiskilled worker, $5.7 \%$ semi-professional and $3.4 \%$ skilled worker. None of the elderly belongs to professional occupation and semi-professional was mainly comprised of businessmen. Above table indicates that about a third of the female and $58 \%$ of the male population were unemployed. In all category of occupation, proportion of male respondent was higher than female respondent except in the category of skilled worker which was found to be $4.7 \%$ among both genders.

## Presence of morbidity

In the present study $72 \%$ of the study subjects had one or the other morbidity, which when compared with another study done in Visakhapatnam by Srinivas P.J. et al., ${ }^{[16]}$ was $64 \%$,and in another study by Krishnamachari Srinivasan et al., ${ }^{[17]}$ 2010A total of 85 per cent of the respondents reported current medical problems.

# Journal of Cardiovascular Disease Research ISSN:0975-3583,0976-2833 

## Morbidity profile

In the present study of 600 elderly, system wise morbidity shows highest number of study participants 434(72.3\%) had visual problems, followed by Musculoskeletal 374(62.3\%), Cardiovascular/HTN 284(47.3\%), 201(33.5\%) Dental problems, 73(28.8\%) Endocrine/DM-2 problems, 148(24.7\%) ENT/Hearing loss, 142(23.7\%) Gastrointestinal, 126(21\%) Anaemia, 93(15.5\%) Skin problems, 72(12\%) CNS, 70.8(11.8\%) Respiratory problems $22.2(3.7 \%), 1 \%$ suffering with Genitourinary problems and Malignancy.
This findings were comparable with study done by Krishnamachari Srinivasan et al., $2010{ }^{[17]}$, Hypertension $49.4 \%$, Diabetes $32.3 \%$, Arthritis $28 \%$, Coronary artery disease $27.9 \%$, Genitourinary diseases $28 \%$, Gastrointestinal diseases $16.6 \%$, Respiratory diseases $15.4 \%$, Dermatological diseases $13.5 \%$, Stroke $5.6 \%$, Tuberculosis $3.9 \%$, Kidney diseases 3.1\%, Epilepsy $2.2 \%$.
In another study done by Surekha Kishore et al., ${ }^{[18]}$ in an RHTC they found, Hypertension was the most common problem ( $41.4 \%$ ), followed by musculoskeletal problems ( $36.8 \%$ ), respiratory problems ( $36.1 \%$ ) and psychosocial problems ( $28.8 \%$ ).
Contrary to the present study, the study done by Narayan V et al., (2013) ${ }^{[19]}$ majority of the elderly patients suffered from chronic obstructive pulmonary disease (COPD) (20.72\%), Ischaemic heart disease IHD $(19.6 \%)$, cataract \& diminished vision ( $13.9 \%$ ), arthritis ( $6.2 \%$ ), diabetes mellitus ( $4.32 \%$ ), cancer ( $3.2 \%$ ), hemiplegia ( $3 \%$ ) \& a host of miscellaneous diseases ( $29.15 \%$ ). The difference may be because the present study was field based and the study done by Naryan et al., was Hospital based study.

## Visual problems

In the present study $433.8(72 \%)$ ocular morbidity was the most common morbidity affecting two third of the study population. Similarly ( $71 \%$ ) Ocular morbidity was observed in a study done by Piramanayagam et al., ${ }^{[20]}$ in 2013 in South India.
Visual problems due to Cataract and refractive errors were seen in $42.5 \%$.
Contrary to our study findings much higher morbidity was observed in a study done by Shiva Kumar et al., (83\%) ${ }^{[11]}$ in 2013 done in Hassan district in Arehalli village.
The most common cause of diminished vision in India, Cataract contributed to $32.17 \%$ in the present study of which males $65(29.4 \%)$ and females are $128(33.8 \%)$ and was comparable with study done by Rahul Prakash et al., $34.7 \%{ }^{[21]}$ males and $60 \%$ females had cataract.
Proportion of females ( $33.8 \%$ ) were more compared to males ( $29.4 \%$ ). Similarly higher occular morbidity due to cataract was observed in females ( $38.7 \%$ ) in a study done by Jadhav et al., ${ }^{[10]}$ in 2012 in Paithan in Aurangabad.
In the present study cataract contributed to $32.17 \%$ whereas it was much higher ( $46.3 \%$ ) in Vandana Nikumb et al., ${ }^{[8]}$ study done in 2015 and $61.25 \%$ in a study done by Sanjiv Kumar Barman et al., ${ }^{[12]} 2014$ done in Kishanganj, Bihar.

## Musculoskeletal problems

In the present study about $62 \%$ hadMusculoskelatal problems which is similar to the study done by Mrinal Ranjan Srivastava et al., ${ }^{[22]} 65.7 \%$ of males and $75.4 \%$ of females had musculo skeletal problems.
Arthritis was the major musculoskeletal Problem contributing to $241(40.2 \%$ ) In the present study whereas it was much higher 89 (55.6\%) in a study done by Vandana Nikumb et al., ${ }^{[8]}$ in 2015 and $75 \%$ in a study done by Shivakumar S. et al., ${ }^{[11]}$ 2013, in Arehalli Village of Hassan District.
Contrary to our study findings it was less $16.22 \%$ in Muralidhar et al. ${ }^{[7]}$ study in 2014, 21.25\% in Sanjiv Kumar Barman et al., ${ }^{[12]}$ in 2014, $19.2 \%$ in Piramanayagam A et al., ${ }^{[20]}$ study in 2013, $24.7 \%$ in S. V. Kamble et al., ${ }^{[23]}$ study in 2012.

## Cardiovascular problems

In the present study Hypertension 284(47.3\%) was one of the common morbidity affecting nearly half of the study population which was the main culprit for cardiovascular problems. Among them majority were females ( $63.7 \%$ ).
Similar findings were observed in, study done by Rahul Prakash et al., ${ }^{[21]} 48 \%$ had hypertension, MK Muralidhar et al., ${ }^{[7]}$ study done in 2014 where more than half of the study population had hypertension ( $56.8 \%$ ) of which proportion of females ( $78 \%$ ) were more when compared with males ( $36 \%$ ).
Similar findings were observed $50.63 \%$ were hypertensive in a study done by Sanjiv Kumar Barman et al., ${ }^{[12]}$ 2014, $44.5 \%$ in Syed Qadri et al., ${ }^{[13]}$ study done in 2013, $44.7 \%$ in Piramanayagam A et al., ${ }^{[20]}$ study done in 2013, $40 \%$ in Shiva Kumar et al., ${ }^{[11]}$ study in 2013, and the overall prevalence of hypertension was $65 \%$ in study done by Sushma Tiwari et al., ${ }^{[24]} 2010$.

# Journal of Cardiovascular Disease Research ISSN:0975-3583,0976-2833 VOL14,ISSUE05,2023 

## Dental problems

In the present study $201(33.5 \%)$ of the study participants had dental problems whereas it was much high $62.2 \%$ in Syed Qadri, SK et al., ${ }^{[13]}$ study done in 2013.
In the present study dental caries was present in $18 \%$ in the study participants.
Whereas it was $21.9 \%$ in Vandana Nikumb et al., ${ }^{[8]}$ study done in 2015 and it was almost double $40 \%$ in
Sanjiv Kumar Barman et al., ${ }^{[12]}$ study done in 2014.

## Endocrine problems

In the present study $28.8 \%$ of the study participants had diabetes mellitus. Similar findings were observed in a study done by Vandana Nikumb et al., ${ }^{[8]}$ in 2015 where $28 \%$ were having diabetes among Geriatric Population in an Urban Area and $27.49 \%$ in a study done by MK Muralidhar et al., ${ }^{[7]}$ in 2014 among Elderly in a Rural Community of Coastal Karnataka.
Our findings do not correlate with the study findings of Barman et al., in 2014 where only $15 \%$ had diabetes done among geriatric population in an urban community of Kishanganj, Bihar \& $9 \%$ in a study done by Syed Qadri et al., ${ }^{[13]}$ in 2013 in northern India, $3.7 \%$ in a study done by Piramanayagam A et al., ${ }^{[20]}$ in 2013 south India.

## ENT/Hearingloss

In the present study $142(23.67 \%)$ elderly were having impaired hearing, whereas it was $10.6 \%$ in Vandana Nikumb A et al., ${ }^{[8]}$ done in 2015., $27 \%$ elderly were having impaired hearing as major ENT problem in a study done by Shivakumar S. et al., ${ }^{[11]}$ in 2013.
In the present study $85(22.4 \%)$ of women were suffering from reduced hearing, similar to the study done by Piramanayagam A et al., ${ }^{[20]}$ in 2013 where $69(24.3 \%)$ women were suffering from reduced hearing.

## Gastrointestinal problem

In the present study $142(23.7 \%$ ) were having GIT problems. In contrast it was $36.4 \%$ in Srivastava et al., study done in 2013.
In our study $60(27.2 \%$ ) males and $82(21.6 \%)$ females had GIT in contrast $41.6 \%$ of elderly males and $36 \%$ of elderly females had gastrointestinal problems in Mrinal Ranjan Srivastava, et al., ${ }^{[22]}$ study done in 2013. In the present study $11.5 \%$ had Acid peptic disease in contrast $22.2 \%$ were suffering with Acid peptic disease in Syed Qadri, et al., ${ }^{[13]}$ study in 2013.

## Anaemia

In the present study $126(21 \%)$ had pallor whereas it was $17.8 \%$ in a study done by Piramanayagam A et al., ${ }^{[20]}$ in 2013.
In contrast it was much higher ( $63.75 \%$ ) in a study done by Sanjiv Kumar Barman et al., ${ }^{[12]}$ in 2014 and $30.8 \%$ in Singh Nirankar et al., ${ }^{[25]}$ study in 2012.
In the present study $15.8 \%$ of male participants and $24.0 \%$ female participants had anaemia compared to study done bySanjiv Kumar Barman, et al., ${ }^{[12]} 2014$ which showed 45(28.12\%) males and 57(35.63\%) females had anaemia.

## Skinproblems

In the present study $15.5 \%$ elderly had skin problems where as it was $4.2 \%$ in a study done by Piramanayagam A, et al., ${ }^{[20]}$ in 2013, $3.52 \%$ in Jadhav V.S, et al., ${ }^{[10]}$ study in $2012,9 \%$ in Shivakumar S. et al., ${ }^{[11]}$ study in 2013.

## Central nervous system problems

In present study $72(12 \%$ ) elderly were having CNS problems. About $8.1 \%$ males and $7.7 \%$ female elderly had memory impairment, whereas it was $41(13.80 \%)$ among males and $27(8.23 \%)$ among females were having senescent forgetfulness in a study done by Jadhav V.S. et al., ${ }^{[10]}$ in 2012.
In our study $8(3.6 \%)$ of males and $7(1.8 \%)$ of female elderly were suffering with CVA whereas it was 14 $(4.5 \%)$ men and $7(2.5 \%)$ women were affected in a study done by Piramanayagam A, et al., ${ }^{[20]}$ in 2013, $18(6.06 \%)$ males and $11(3.35 \%)$ females suffered from Hemiplegia in a study done by Jadhav V.S, et al., ${ }^{[26]}$ in 2012.

## Respiratory problems

In the present study $71(11.8 \%)$ elderly were had respiratory problems similar findings $11.9 \%$ were observed in a study done by Vandana et al., ${ }^{[8]}$ 2015, $12.8 \%$ in Piramanayagam A, et al., ${ }^{[7]}$ study in 2013, $10.3 \%$ in Nirankar et al., ${ }^{[25]} 2012$.
In the present study $4 \%$ of the study subjects had Bronchial Asthama and similar finding were seen in study done by S V Kamble et al., ${ }^{[23]}$ prevalence of asthma ( $2.6 \%$ ) and chronic bronchitis ( $2.4 \%$ ).
In the present study $3(0.5 \%)$ elderly were having T.B. similar findings were observed in a study done by $0.7 \%$ in Piramanayagam A, et al., ${ }^{[20]}$ study in 2013.0.5\% in Nirankar et al., ${ }^{[25]} 2012$.
In the present study $4 \%$ had Bronchial Asthma, similar findings 5\% were observed in Shiva Kumar S. et
al., ${ }^{[26]} 2013,3.2 \%$ in Piramanayagam A, et al., ${ }^{[20]}$ study in 2013, 6.6\% in Nirankar et al., ${ }^{[25]} 2012$.

## Genitourinary problems

In the present study $22(3.7 \%$ ) elderly were having genitourinary problems similar findings $4,5 \%$ were observed in Piramanayagam A, et al., ${ }^{[20]}$ study done in 2013. Whereas much higher prevalence was found $8 \%$ in Shivakumar S. et al., ${ }^{[11]}$ study in 2013. Low prevalence $1.7 \%$ was found in Shraddha K, et al., ${ }^{[14]}$ study in 2012.
In the present study More men $11(4.1 \%)$ were affected by genitourinary problems compared to women 11 ( $1.3 \%$ ). Similar findings were observed in Piramanayagam A, et al., ${ }^{[20]}$ study in 2013 where $6.2 \%$ males and $3.2 \%$ females had genitourinary problems.
In the present study $14(2.3 \%)$ had incontinence similar findings ( $1.7 \%$ ) were observed in Piramanayagam A, et al., ${ }^{[20]}$ study done in 2013,0.9\% in Shraddha K, et al., ${ }^{[14]}$ study in 2012.

## Malignancy

In the present study $6(1.0 \%)$ subjects were suffering with malignancy.
In our study $0.8 \%$ of females had malignancy whereas it was $2(1.62 \%)$ in MK Muralidhar, et al., ${ }^{[7]}$ study in 2014. In contrast $3.04 \%$ females were suffering with cancer in Jadhav V.S. et al., ${ }^{[10]}$ study in 2012.

## Activities of daily living

In the present study about $95-99 \%$ of the study participants were independently performing Activities of Daily Living which is comparable to study done by MK Muralidhar et al., ${ }^{[7]}$ 2014, $89 \%$ of the study subjects were independent in performing ADL activities and study done by (Indarjeet Singh Gambhir et $a l .,)^{[26]} 2014,92.8 \%$ were independent in performing ADL activities and there were $60 \%$ respondents independent in doing ADL activities in a study done by Mohan Chandra Dolai et al., (2013) ${ }^{[27]}$.
In the present study with respect to Activities of Daily Living (ADL), $96.8 \%$ of the elderly were able to do bathing independently. Only $3.2 \%$ were depending on their family members for taking bath. In contrast $79 \%$ were independent and $21 \%$ were found to be dependent for bathing in Harindersekhon et al., ${ }^{[28]}$ study in 2014.
In the present study with respect to Activities of Daily Living (dressing up), majority ( $96.8 \%$ ) of the elderly were able to dress up independently. In contrast only $80 \%$ were able to do it independently in Harinder Sekhon et al., ${ }^{[28]}$ study in 2014.
In the present study with respect to going to toilet, majority $582(97 \%)$ were able to manage independently. In contrast only $77 \%$ were able to do it independently in Harinder Sekhon et al., ${ }^{[28]}$ study in 2014.
In the present study, $581(96.8 \%)$ of the elderly were independently able to move from one place to another where as it was observed only $80 \%$ of the elderly in Harinder Sekhon et al., ${ }^{[28]}$ study done in 2014.
In our study only few ( $2.7 \%$ ) of the elderly were seeking assistance from family members for taking food. Contrary to our study findings this was observed in $23 \%$ in Harinder Sekhon et al., ${ }^{[29]}$ study.
In a study on physical and mental health status and functional ability of geriatric population in an urban area of Delhi: A community-based cross-sectional study done by Meera Dhuria et al., ${ }^{[29]}$ (2014) reveal that out of total 250 subjects, $176(70.4 \%)$ were found to be independent with regard to ADLs.
In the present study increasing in age is associated with ADL dependency which is similar to study done by Krishnamachari Srinivasan et al., ${ }^{[17]} 2010$ disablement was significantly associated with age.

## Instrumental activities of daily living

With respect to Instrumental Activities of Daily Living in the present study 573 ( $95.5 \%$ ) were able to selfadminister their medicines, only $37(6.2 \%)$ seeking help from others.
In our study $83.7 \%$ able to do grocery shopping, $78.2 \%$ able to prepare meals, $13.5 \%$ were able to drive, $27.8 \%$ were able to handle own finances.
Out of 250 elderly majority of the subjects ( $\mathrm{N}=177,70.8 \%$ ), were dependent with regard to instrumental activities of daily living (Meera Dhuria et al., ${ }^{[29]}$ ) and in study done by Mohan Chandra Dolai et al., ${ }^{[27]}$ $83.93 \%$ respondents were dependence on IADL.
About $19.8 \%$ elderly have decreased IADL with $12.8 \%$ in a single activity, $6 \%$ in two activities, $1 \%$ in three activities and $0.1 \%$ in four activities. Aclinico-epidemiological study of cognitive function status of community-dwelling elderly Indarjeet Singh Gambhir et al., (2014) ${ }^{[26]}$.
In the present study only males $44.8 \%$ of males and $80.5 \%$ were unable to use telephone as compared to the study done by Meera Dhuriai et al., ${ }^{[29]}$ (Delhi 2014) where proportion of males and females who had difficulty in using the telephone was 71.2 per cent and 73.7 per cent respectively.
In the present study $70.6 \%$ of males and $95.8 \%$ of females had difficulty in moving and transport as compared the study done by Meera Dhuria et al., ${ }^{[29]}$ (Delhi 2014) ( $61.8 \%$ ) females ( $42.4 \%$ ) males had difficulty in walking around.
In the present study $12.7 \%$ of males and $18.5 \%$ of females had difficulty in grocery shopping as compared with the study done by Meera Dhuriai et al., ${ }^{[29]}$ (Delhi 2014).
Grocery shopping was a difficult task for ( $28.8 \%$ ) males and ( $61.0 \%$ ) of females.
In the present study $5.4 \%$ males and $6.6 \%$ females had required help in taking their own medication as

# Journal of Cardiovascular Disease Research ISSN:0975-3583,0976-2833 VOL14,ISSUE05,2023 

compared with study done by Meera Dhuria et al., ${ }^{[29]}$ (Delhi 2014) $25.4 \%$ of males in dependent category required help in taking their own medications whereas $43.2 \%$ of females were totally dependent for the same on others.
In the present study $47.5 \%$ males and $86.5 \%$ females were having dependency in managing their money (counting and keeping an account) as compared with study done by Meera Dhuriai et al., ${ }^{[29]}$ (Delhi 2014) showing the dependent males $20.3 \%$ and $46.6 \%$ females.
In all the instrumental activities of daily living the females were significantly more dependent as compared to males.

## Conclusions

The majority of the elderly were "young old" people between the ages of 60 and 65 . Targeting this group should be the main focus of the plans and initiatives in the health sector. Since women made up the majority of the study population, their gender distribution accurately reflects that of the rest of the nation. Additionally, this suggests that senior ladies should be the focus of health security and policy. The elderly should not only receive discounts, but also have access to geriatric clinics at their doorstep as $20 \%$ of senior couples were living alone and without immediate support from young people. In the current study, visual problems ( $72 \%$ ) musculoskeletal issues ( $62 \%$ ), and hypertension ( $47 \%$ ) were at the top of the list; as a result, these issues must be addressed before any other geriatric issues. Gender, education, and socioeconomic level did not significantly correlate with the presence of morbidity. Therefore, health care for the elderly should be made available to everyone, regardless of gender, education, or socioeconomic level. In the current study, daily living activities were not an issue because $95-98 \%$ of participants could do them on their own. The majority of the female participants in instrumental daily living tasks were still reliant on others for things like phone use ( $80 \%$ ), transportation ( $96 \%$ ), and handling funds ( $86 \%$ ), thus it is crucial to empower elderly women in these areas.
